

8. Delicious Test Reports With Allure

The best test suite can be almost useless without a proper reporting system, so let's get started with the last topic of our practical CodeceptJS journey.

Allure is a pretty neat reporting standard which is supported by CodeceptJS and the first choice when it comes to test reports.

We can install Allure by running

```
npm install allure-commandline --save-dev .
```

Then in the `codecept.conf.js` file add "allure" under the "plugins" object:

```
"plugins": {  
  "allure": {  
    "enabled": true  
  }  
}
```

Then re-run your test with `npx codeceptjs run --steps`.

When finished, open a new terminal tab, change into the project directory and serve the allure reports with `npx allure serve output`.

That's the way to get sexy CodeceptJS test result reports :) - Enjoy!
